

# THE PREVENTIVE MAINTENANCE MONTHLY

TB 43-PS-608, The Preventive Maintenance Monthly, is an official publication of the Department of the Army, providing information for all soldiers assigned to combat and combat support units and all soldiers with unit maintenance and supply duties. All information published has been reviewed and approved by the agency responsible for the equipment, publication or policy discussed. Application of the information is optional with the user. Masculine pronouns may refer to both genders.

# WHERE WERE YOU WHEN THE LIGHTS WENT OUT?

Napoleon said, "An army marches on its stomach." But Napoleon said that before there was power generation equipment.

The Army you serve in not only moves but does hundreds of things because of generated power.

It is generated power that launches missiles.

It is generated power that sees missiles coming your way.

It is generated power that keeps commo shelters humming.

It is generated power that directs your fire to silence the enemy.

It is generated power that lights your tent and lets you write that letter home to your sweetheart.

It is generated power that lets you read late at night that letter from your sweetheart so you can finally fall asleep.

It is generated power that lets you use electrical equipment on the battlefield.

The question, "Where were you when the lights went out?" is really the question "Where were you when your power generation equipment failed?"

The answer: in the sights of the enemy.

Preventive maintenance on generators is not optional. A generator that has not had PM is a generator that is doomed to fail.

A failed generator makes you a Napoleonic soldier fighting a 21st Century enemy.

M1-Series Tanks...

# PUMP UP TURRET SEAL

WAIT!!  
YOU NEED TO  
PUMP UP MY  
TURRET SEAL  
FIRST!

WHEN IT'S TIME TO  
TAKE YOUR TANK TO THE  
WASH RACK FOR A  
GOOD CLEANING, YOU'D  
BETTER REMEMBER TO  
PROTECT THE TURRET  
RACE RING, DRIVERS.

When water is forced inside the race ring, grease is washed away. Dirt gets inside and corrosion starts. That leads to damage to the springs, ball bearings, and the race itself. Eventually the turret will lock up and no longer traverse.

Fixing the damage is difficult and costly, so avoid it by using the turret's inflatable seal to keep wash water out. You'll find the inflatable seal on all M1, M1A1 and some M1A2 tanks.

Engage the turret traverse lock mechanism, close the bleed cock below the inflatable seal's pressure gauge and pump the handle until the gauge reads 25 psi. If the seal won't inflate to 25 psi, let your mechanic know. The seal could be damaged.

Pump handle  
until gauge  
reads 25 psi

**Do not** try to traverse the turret with the seal inflated. That damages the seal.

After washing the tank, deflate the seal by opening the bleed cock under the gauge and allowing the pressure to drop to 0 psi. Then disengage the turret lock mechanism.

Don't forget to grease the turret race ring monthly with WTR, too. That keeps corrosion away and the race ring turning smoothly.

Lube race ring monthly  
with WTR

M1A1 Tanks...

# SHEDDING A LITTLE LIGHT

DIDN'T YOU  
SEE AN NBC  
WARNING  
LIGHT!?

SURE,  
BUT IT  
WAS JUST  
A CAUTION  
LIGHT!

I DIDN'T  
KNOW IT  
WAS THAT  
SERIOUS!

**B**oth the OVERHEAT SPONSON IN and OVERHEAT SPONSON OUT warning lights on the tank commander's panel are yellow.

They should be red. They're supposed to be warning lights, not caution lights. Ignoring the lights could result in an NBC filter fire.

If you've not yet made the switch, get your mechanic to replace those yellow covers with red ones, NSN 6210-00-176-4954.

Change covers to red on OVERHEAT SPONSON IN and OUT lights

# USE CARC ON THE INSIDE

Dear Half-Mast,

My soldiers want to improve the appearance inside their Bradleys. The paint inside is old, scratched, and generally pretty bad-looking. I've been unable to find anything on what kind of paint to use. Do we use regular enamel or CARC? Should the paint be fire retardant or rust-resistant?

SSG J.A.C.

Dear Sergeant J.A.C.,

Since you need the same chemical agent protection inside as you do outside your vehicle, green CARC is the paint to use. Get a 2-qt kit with NSN 8010-01-419-1162 and a 1-gal kit with NSN 8010-01-419-1147. NSN 8010-01-193-0516 brings a quart of white epoxy primer.

Both kits bring a two-component CARC paint that consists of a polymer resin and a curing agent that must be mixed in a four-to-one ratio. That allows you to mix up only as much paint as you need and save the rest for later.

Remember that touch-up painting is done to prevent corrosion, not for purely cosmetic reasons.

Check out TB 43-0209, Color, Marking and Camouflage Painting of Military Vehicles, Construction Equipment and Materials Handling Equipment, and TB 43-0242, CARC Spot Painting, for safety information when spot painting with CARC.

# NMC? NOT NECESSARILY!

Dear Editor,

A lot of our crewmen report their Bradleys as NMC because the warning lights don't come on during PMCS of the turret drive system. When we investigate, however, everything checks out.

I think the problem may be due to some confusion with the PMCS tables, specifically Check 23 on Page 0069 00-67 of TM 9-2350-284-10-2 (A2 Bradley) and Check 24 on Page 0079 00-65 of TM 9-2350-284-10-2-1 (ODS Bradley).

With the TURRET DRIVE SYSTEM switch set to ON, the two turret drive warning lights should come on. However, if the turret shield door is open and the combat override switch is on, the warning lights will stay dark, even if the turret drive system is working.

Can you let Bradley crewmen know that the turret shield door should be closed and the combat override switch off when doing this check?

SGT Joseph M. Skaggs, Jr.  
B Trp, 1/1st Cav  
Buedingen, Germany

Warning lights stay dark if shield door is open and combat override switch is on

From the  
desk of  
the Editor

Consider  
it done,  
Sergeant.

# NEVER FORGET THE LEVER

You want your M577's 4.2-KW generator to be full of hot air during the winter, not the summer, crewmen. That's why the engine air shutter has a SUMMER/WINTER lever.

During cold weather, setting the lever to WINTER deflects cold incoming air past the exhaust manifold. The preheated air makes for easier restarts and a smoother run.

Flip lever to WINTER during cold weather...

Unfortunately, some crewmen forget to move the switch back to SUMMER when the temperatures go back up. Already hot air becomes scorching. The generator's air filter is toast.

So do your 4.2-KW a favor. Flip the engine air shutter lever to WINTER when it's cold and to SUMMER all the rest of the time.

...and SUMMER all other times

# POP! GOES THE DIPSTICK

If tight is good, then tighter must be better. Right, crewmen?

Not when it comes to the transmission oil dipstick. After checking the oil level before and after operation, you have to turn the T-handle on the dipstick to lock it in place. Turning the T-handle makes the gasket under the top of the dipstick expand to completely seal the opening.

But if you turn the T-handle too far, the dipstick can pop loose like a cork, especially after a few road bumps during operation. With a loose dipstick, it's easy for water from cleaning or low-water fording to get splashed into the neck and contaminate the transmission.

SO GO EASY WHEN LOCKING THE DIPSTICK IN PLACE.

THEN, TAKE A GANDER AT IT EVERY NOW AND THEN TO MAKE SURE IT'S STILL FIRMLY IN PLACE.

Can you tell me what the tape is for and how to get new tape to replace the old stuff?

SFC J.B.

*Yes and no! The old tape was designed to cushion the torsion bars during transport and handling. It prevented dings and cuts that could weaken the torsion bars and allow them to snap.*

*There is no requirement for replacing the tape. In fact, tests have shown that the tape can trap moisture, allowing corrosion to get a foothold.*

*Your best bet is to remove the old tape. If you receive any more torsion bars with tape already applied, remove it before installation.*

## Half-Mast

NO FRH OR  
TURBOSHAFT  
OIL WORRIES  
FOR ME!

KLANK  
KLANK  
KLANK  
KLANK

The fire resistant hydraulic (FRH) fluid, MIL-H-46170, and turboshaft oil, MIL-L-23699, used in your combat vehicles are safe—as long as you take the right personal protective measures.

FRH and turboshaft oil both contain tricresyl phosphate (TCP) that, when taken internally, can cause physical paralysis. Of course, no one would purposely drink hydraulic fluid, but TCP can also be absorbed through contact with the skin.

And the effects of TCP are cumulative. A little exposure today, a little tomorrow, and some more next week all add together and build up in your system. Enough exposure over a long enough period can result in paralysis.

TCP is in such a low concentration that the proper protective equipment and good hygiene practices make FRH and turboshaft oil safe to use.

Gloves, long sleeves, an apron, goggles and a face shield provide good protection. Just make sure you wash up with soap and water after using FRH and turboshaft oil. Never eat, smoke, or rub your eyes before cleaning up.

Always wash your clothing before wearing it again, too. Normal washing with detergent removes all traces of TCP.

**GOOD  
KNIGHT!**  
THAT'S NOT  
THE RIGHT  
PROTECTION  
FOR FRH AND  
TURBOSHAFT  
OIL!

# Your Slave Cable Connection

THERE'S A LOT MORE INVOLVED WITH USING THE NATO SLAVE CABLE THAN JUST PLUGGING IT IN.

KNOWING THE RIGHT PARTS TO ORDER AND HOW TO FIX THE CABLE YOU ALREADY HAVE IS PRETTY IMPORTANT, TOO.

NSN 6150-00-398-6527 gets a cable *without* end connectors

NSN 6150-01-022-6004 gets a cable *with* end connectors

NSN 5935-00-567-0128 gets one end connector

NSN 5935-00-322-8959 gets one connector adapter that allows either end of cable to fit two-hole receptacles (2 adapters come with complete cable)

## Shock Stopper

Before slaving your vehicle, eyeball where the wiring goes into the end connector. Look for bare or exposed wires where insulation has pulled back from the connector housing.

YOU'LL GET A REAL CHARGE FROM YOUR SLAVE CABLE IF YOU TOUCH ONE OF THOSE BARE WIRES WHILE YOU'RE HOOKING UP. HERE'S HOW TO MAKE IT SAFE AGAIN:

Check here for bare or exposed wires

1. Remove the connector's back plate, then disconnect the cable from the connector.
2. Cut off the terminal lugs. Strip back just enough insulation to put on new terminal lugs, NSN 5940-00-115-5004.

3. Reconnect the cables to the connector. Make sure the positive lead (+) is reconnected to the center post and the negative lead (-) is reconnected to the negative cup of the connector.
4. Reassemble the connector.

## Connector Cover Fix

If the connector inserts pull out, the cover won't seal tight. Water gets inside and corrodes the cables. Fix loose insert problems like this:

1. Remove cover plate

2. Remove the inserts by threading in a screw and gently wiggling the insert until it comes out the body of the connector.

3. Fill each hole about halfway with silicone adhesive caulk, NSN 8040-00-865-8991.

Remove loose inserts and fill holes with caulk

4. Press the insert back into the hole, making sure it's flush with the surface of the connector. Let the caulk cure for an hour or two so the inserts stay in place.
5. Run a thin bead of silicone adhesive caulk around the connector lip and screw down the cover. Wipe off any caulk that oozes out. Again, let the caulk cure for an hour or two before using the cable.

To get back into the connector the next time, remove the screws and use a sharp knife to cut the caulk.

# BEAT THE HEAT

HELP...  
ME!  
I'M OVER-  
HEATING AND  
MELTING!

NOTHING  
LIKE STARTING  
YOUR DAY...

...WITH A  
NICE HOT  
MEAL!

**W**hen operating in temperatures above 100°F (38°C), you operators must take extra care to prevent overheating the vehicle. Overheating starts when the engine temperature exceeds 230°F (110°C).

- Watch the water temperature gauge, STOP engine indicator and High Engine Temperature indicator closely for signs of overheating.

Check  
temperature  
gauge...

...STOP indicator and  
High Engine Temperature  
indicator

- Check oil levels often and keep operating strains as low as possible. Since the cooling and lubrication systems support each other, failure of one system will quickly lead to the failure of the other.

- Check the battery fluid level often in extreme heat. Batteries do not hold their charge well in extreme heat, so the specific gravity must be adjusted. See TM 9-6140-200-14 for details.

- Never operate the vehicle with the Radiator Fan Off switch in the ON position. That means double-check that the engine fan OFF indicator is **not** lit.

Radiator Fan Off switch...

...should be OFF so fan can run

- Always idle the engine before shutdown. That cools the engine and prevents damage.

- Never operate the engine longer than 30 seconds at full throttle if the vehicle is not moving. (For example, while operating the self-recovery winch or other auxillary equipment.) That quickly raises transmission oil temperature and can damage the transmission. Watch the service indicator light in the shift window. If it lights up, or if the water temp gauge gets near 230°F (110°C), the transmission oil is overheating.

Keep an eye  
on service  
indicator  
light

- Avoid driving diagonally up or down a hillside. You can lose control and roll the vehicle.

HEY, IN THERE!  
DON'T SLIDE OVER IN YOUR SEAT ANY FURTHER!  
OR I'LL BE SLIDING OVER!!

WHOA!  
YOU'LL HAVE TO DRY MY BRAKES OUT NOW!

Operating in mud gets brake linings wet

- Operating in mud gets the brake linings wet. That greatly reduces braking power. To dry the brakes, first find a dry area, or at least an area where the brake drums will be totally out of the mud. Drive the truck about 500 feet, applying the service brakes frequently. If you still have problems with the brakes, call in your unit mechanic.

- Keep high-pressure water, steam and air away from glass surfaces, seals, air intake, exhaust outlet, and any other component that might be damaged.

- Keep glass surfaces covered whenever possible to prevent scratching by dust and sand.

- When operating in sand or mud, set the CTIS system to SAND mode, the transmission shift selector to MODE ON, and select a lower gear range for added traction.

Put CTIS on SAND...

- Watch for sand and dust accumulation on the radiator. Too much accumulation can cause the engine to overheat. Use low-pressure water or air to clean away dust and sand.

- Clean mud off the vehicle as soon as possible. Pay special attention when cleaning to the wheels, brakes, axles, universal joints, steering mechanism, radiator and oil cooler.

- Cover the air intake, radiator and cab with a tarpaulin when the vehicle will not be used for a while.

- Park the vehicle with the front facing away from the wind.

HEMTT...

## REMOVE ETHER CARTRIDGE

The hot and humid days of summer means it's time to remove the HEMTT's ether cartridge.

Summer weather causes the cartridge to rust and leak. Then the vehicle's ether start won't kick in when you need it for those winter months down the road.

So do your HEMTT a favor. Remove the cartridge in the summer or in places where it's warm all year around. The cartridge is there only to help the truck start in cold temps.

Just unscrew the cartridge from the solenoid valve and plug the hole with the cap that is chained to the solenoid.

Be sure to store the ether cartridge in a cool, dry place so it can be put back on when you need it—in cold weather.

HEMTT...

When filling a new HEMTT radiator, don't be fooled into thinking it's full when it's not, mechanics.

There's a lip just inside the radiator opening that can hold some fluid and make it appear to be full when it's not. What's worse, the heat sensors are located near the top of the radiator, so they don't get tripped by the overheated fluid in a partially-full tank.

The end result is an overheated engine. So keep putting coolant into the radiator until it reaches the bottom of the filler neck.

# STEP UP

# AFTER REFUELING

DRIVERS, THERE ARE **TWO** VERY IMPORTANT STEPS TO REMEMBER WHEN YOU'VE FINISHED FUELING ANOTHER VEHICLE WITH YOUR M978 FUEL TANKER.

**Step 1:** Always walk the hand-activated valve (HAV) back to its reel when you've finished pumping. If you let it fly, the rough landing damages the air hoses.

If the HAV is lucky enough to make it through the reel window on the fly, it still takes a beating. The jolts on the air lines can be bad enough to pull the hoses away from the control.

If that happens, fix the HAV yourself. Just cut off a couple of inches of hose and push it back over the fitting. Then, secure the hose in place with a screw-type hose clamp, NSN 4730-00-363-4102.

Use clamps to reattach hoses

WHILE YOU'RE AT IT, INSTALL A BALL STOP, NSN 5340-01-361-2014, ON THE HOSE. IF YOU ACCIDENTALLY LET GO OF THE HAV, THE BALL STOP TAKES MOST OF THE PUNISHMENT INSTEAD OF THE AIR HOSE.

INSTALLATION INSTRUCTIONS ARE IN PARA 18-16 OF TM 9-2320-279-20-3.

**Step 2:** Take your time when reeling in the fuel hose. Go too fast and the hose won't wind in evenly.

A poorly stacked hose sticks out past the reel far enough to touch the rear door. As you drive the tanker, the hose rubs against the door and wears a hole. The tanker is NMC for fueling operations until the hose is replaced.

# PM For Patrioteers

There's nothing better than powerful PM for the Patriot system. For instance:

## Antenna Mast Group

When operating the two pneumatic pumps on the AMG, take the pumps' cover completely off. Otherwise, heat becomes so intense that it melts the plastic guard over the fan. Then the motor overheats.

## EPP3

Remember the oil levels will be different depending on whether the EPP3 is shut down or running. If you check the oil while the generator is running, the level will be lower. Then you mistakenly overfill with oil and pop the seals. See the sticker above the EPP3 dipstick for the proper way to check the oil. The generator normally uses oil, so check the oil level daily in the field.

## M983 Truck

Watch your feet around the M983's sensor for the power take-off (PTO). It is often snapped off by a misplaced boot, especially when crews are putting up camouflage or doing PMCS. No sensor deadlines the truck.

You can now order a PTO guard with NSN 3020-01-426-4824.

Don't check the M983's transmission fluid without letting the engine warm up to operating temperature. Crews are checking the fluid with the engine cold and that gives a low reading. Too much fluid is added to the transmission and that blows transmission seals. The engine temp should 160°F for the check. Add just enough fluid to reach the HOT RUN on the dipstick.

During weekly PMCS, check for the dust caps for the four rear brake chambers. The old-style caps often disappear and without them dirt gets in the brakes and weakens their stopping power. It's a good idea for your repairman to keep extra caps on hand. He can order them with NSN 5340-01-163-2073. Newer dust caps are held in place with a screw.

# SHOOTING DOWN

# GUN PROBLEMS

## Cleaning

The M3P is not your rifle—you don't clean and lube it with CLP. Instead, clean it with RBC (rifle bore cleaner) and lube it with TW-25B, NSN 9150-01-439-0859. But keep TW-25B away from the inside of the barrel. It damages the barrel liner.

While you're cleaning, pay particular attention to the pawl on the feed cover. Dirt, carbon, and brass shavings build up behind the pawl and cause it to bind. That leads to poor feeding. Use the small brush in your tool kit to clean around the pawl. If the pawl still binds, your repairman needs to take the feed cover apart and clean it.

## Headspace

If the M3P loses headspace, it will jam. The bolt and barrel may be damaged. A weak barrel locking spring is the usual cause for bad headspace. Letting the spring ride on the barrel when you turn the barrel weakens the spring.

Prevent that by holding the spring up with a screwdriver as you screw the barrel in or out. Once the barrel is locked in, try to turn it. If you can turn it at all, don't fire! The spring needs to be replaced.

TWO AREAS TO CHECK DURING PMCS ARE...

- The clip for the pin that locks the M3P to the mount. Without the clip, the pin can come out and then the gun bounces around on the mount.

## PMCS

- The two pins that hold the ammo box in place. Make sure they're both in place and can be installed. The ammo box bracket is often knocked out of alignment and the pins won't go in their holes. Then the ammo box can't be locked in place.

Two pins present? Do they fit in bracket?

## Installation

Unless you have long, skinny fingers, you'll find it difficult to tighten the cable for the M3P. Once you have the cable connected, use needle-nosed pliers to tighten the connector.

## Rate of Fire

The wrong rate of fire will cause feeding problems. Check the rate of fire on the CDT (control display terminal). It should be 950 to 1,100 rounds per minute. If it's off, reset it like it says on Page 4-31 in TM 9-1425-433-10.

Check rate of fire on CDT

MLRS Launcher...

# KEEP WATER OUT WHEN CLEANING

A GOOD WASHING IS THE BEST WAY TO KEEP YOUR MLRS NICE AND CLEAN. BUT BEFORE YOU GRAB THAT WATER HOSE, KEEP THESE THINGS IN MIND...

- Tighten all LRU cables and cannon plugs before washing. Loose connectors will let in water that can cause short circuits.
- Cover the electronics unit (EU) and electronics box with a plastic bag before washing. Both boxes have a gasket to protect against water, but you never know when the gasket will go bad. The bag provides an extra line of defense. Don't forget to remove bag after washing it.

- Park the vehicle so water can drain freely from the hull. Make sure all drain plugs are unclogged.
- Never use high pressure water for cleaning. That will force water past any protection.

TO  
STRUT  
OR  
NOT TO  
STRUT-

**T**here's a time and a place for everything—including the jury struts on your MLRS launcher.

You **need** the struts when working under the launcher. That protects you from a collapsing launcher in case of a hydraulic failure.

You **don't need** the struts when traversing the launcher.

Sure, it may seem like a waste of time to remove the struts, traverse the launcher a few feet, and then install 'em again to continue your work. But if jury struts are left in while traversing, it's easy to hit the UP, DOWN, or STOW button. That puts extra stress on the cage and elevation actuator supports and can wallow out the holes where the jury struts are attached.

So do yourself and your launcher a favor. Know when and when not to use the struts.

## A TALE OF TWO CAMPS

(and the generators that powered them)

IT WAS THE *COLDEST* OF TIMES. IT WAS THE *HOTTEST* OF TIMES. IT WAS THE AGE OF FOOLISHNESS.

IT WAS A CAMP THAT WAS COLDER THAN A VILLAIN'S HEART. IT WAS A CAMP THAT WAS HOTTER THAN A JALAPENO ENCHILADA. THIS IS THE TALE OF *TWO GENERATORS*, SONNY AND CLOUDY,

I THINK I'LL LET *THEM* TELL YOU THE STORY.

WHO THE DICKENS WAS THAT?

*BEATS ME!* I'M STILL TRYING TO FIGURE OUT HOW WE'RE ABLE TO TALK!

"CLOUDY WAS SHIPPED NORTH TO CAMP FROZEN TOES."

"SONNY WAS SHIPPED SOUTH AND WENT TO CAMP BLUE BLAZES."

I THINK I UNDERSTAND IT. WELL, PARTLY ANYWAY.

PARTLY, CLOUDY?

JUST TELL THE TALE.

# TAIL ROTOR PYLON CHAFING?

Dear Editor,

Black Hawk aircraft vibration chafes the tail rotor pylon between the antenna cover and the right side attaching receptacles on the fairing assembly.

We remembered reading an article in PS 442 that solved this chafing problem. It suggested applying a rubber strip, NSN 9230-00-878-6507, along the chafed areas, including the receptacles.

Here's the fix:

- Clean the receptacles and the area between the receptacles where the antenna cover makes contact.
- Trim the rubber strips to fit and lay them aside.
- Apply a thin coat of adhesive, NSN 8040-00-097-6524, along the chafed area of the pylon.
- Firmly press the rubber strips onto the adhesive.
- Let the adhesive cure at room temperature for 24 hours.

Because the rubber strip is only 1/16 inch thick, it will *not* prevent you from latching the cover to the pylon.

SSG Jason White  
AVCRAD (LAAASF) CA

**From the desk of the Editor**

That fix will put that nagging chafing problem to rest.

AH-64A/D and  
UH-60A/L...

# COVER UP

I THINK YOU'D  
BETTER **COVER  
UP** THE STABILATOR  
BEFORE YOU GET  
TO WORK ON THE  
TAIL ROTOR.

**GOOD  
IDEA!** I  
DON'T HAVE  
TIME FOR  
DAMAGE!

To protect furniture from food spills, rips, damage, and busy kids, covers are worth their weight in preventing costly cleaning and repairs.

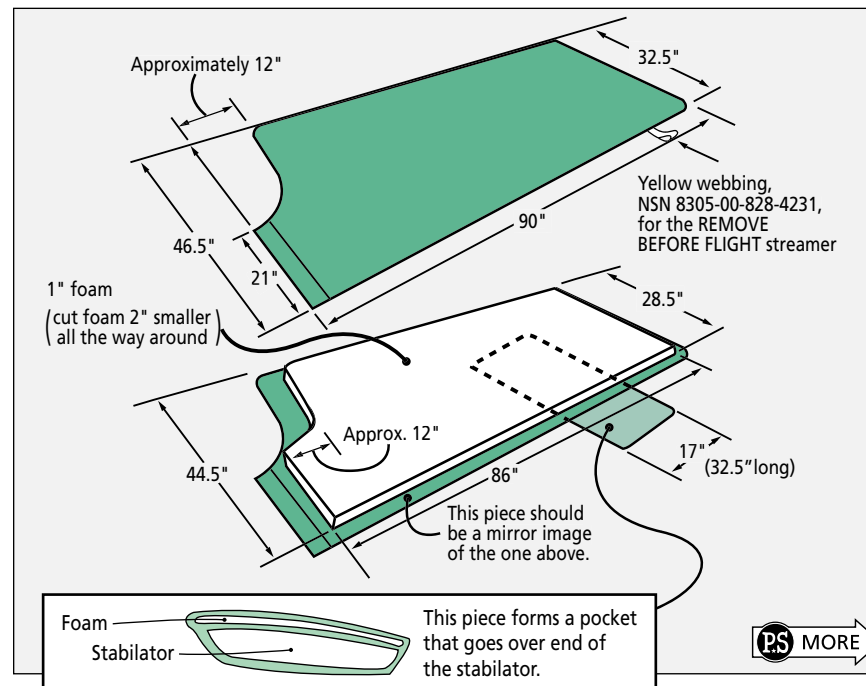

To protect a Blackhawk or a Apache stabilator from dropped tool damage, mechanics, a cover is worth its weight in gold in preventing unnecessary and costly maintenance repairs and aircraft downtime.

If you have any type of cover, use it on the stabilator or canvass to protect the skin from tools like wrenches, hammers and screw drivers that might puncture, dent or damage the stabilator.

If you drop tools on an uncovered stabilator while performing tail rotor maintenance, your bird is grounded until the AVIM shop repairs minor nicks or dings—or replaces it if the damage is severe enough and can't be fixed.

If you need a cover, have your upholstery shop make a right and left piece with the following instructions.

The cover is made from red vinyl, NSN 8305-00-273-8650, and uses fire retardant and flame resistant foam as insulation that you can purchase locally.

- Begin sewing the top and bottom together, leaving one of the long sides open for inserting the foam.
- After inserting the foam, finish sewing the two pieces together.
- Before installing pocket panel, be sure to reinforce the opening edge by folding it over 1 inch and sewing or installing webbing on that edge for reinforcing the pocket. Sew in a web tab for the safety streamer.
- From the outer end of the trailing edge, leave a 7-in opening 5 inches from the corner to allow opening for the static wick.
- Once you've made the first piece, then make another one that's the mirror image of the first one. (You need two pads—one for the left half of the stabilator and another one for the right half.)
- The two pads will fasten together at the center of the stabilator with hook and pile fasteners as the diagram shows below.
- Assemble REMOVE BEFORE FLIGHT streamer, NSN 8345-00-673-9992, and attach to sewn-in tabs. Use wire rope and swaging sleeve, NSN 4030-00-960-1654, to attach the streamer.

If your unit does not have a shop that can make the cover, contact Fred Reschman at the CA AVCRAD, (559) 347-5575.

UH-60A/L...

# PROTECT YOUR NOGGIN

WATCH YOURSELF WHEN YOU GET UP.

HEY, WE'RE IN **GOOD SHAPE** NOW THAT WE HAVE THE BLADES COVERED!

**GREAT JOB, SOLDIERS!**  
ANOTHER FIRST-CLASS IDEA TO ENSURE MAINTENANCE IS DONE WITH SAFETY IN MIND!

Dear Editor,

Even though we take extreme care when we work on the Black Hawk main rotor blades, mishaps still happen.

When mechanics perform main rotor head work, they sometimes bump their noggins on the blades as they maneuver on top of the bird. An occasional small bump on the head is OK, but in many cases, mechanics bang their heads pretty hard on the main rotor blade trailing edge. If that happens, the sharp edge can gouge out a piece and that may require an emergency room visit for stitches.

We've come up with a quick fix.

We local purchase a foam tube (swimming pool tube) with a hole in the center, 2 inches in diameter and 5 feet long for each blade. Then we cut the tube from the center out all the way through and install it on the trailing edge of all four blades to save our skulls. 'Course, we always attach a REMOVE BEFORE FLIGHT streamer to each foam tube.

Pascual Arances Jr.  
Moffett Field, CA

**From the desk of the Editor**

Good thinking! No more busted and stitched up heads.

# The Bird Blocker

LOOKS LIKE WE'VE GOT A STOWAWAY!

HEY, YOU KNOW BIRDS OF A FEATHER FLOCK TOGETHER.

TRY THIS BIRD BLOCKER TO KEEP 'EM OUT!

Dear Editor,

During our 10-hr/14-day Black Hawk inspection, we came across a bird's nest nestled in a hole underneath the cambered fairing of one of our helicopters.

While our aircraft sit on the flight line, birds can squeeze through the opening where the stabilator and the stabilator actuator connect. Having found a great spot for a home, they build nests.

Bird nests can present a FOD problem. And because nests hold moisture, they can create corrosion. When the nest dries, the grass gets hot and creates a potential fire problem, too.

We removed the nest, and made a bird blocker out of rubber foam. We placed the blocker's thin front end between the stabilator and the fairing to cover the opening. We attached a REMOVE BEFORE FLIGHT streamer. That keeps those pesky birds from making *our* bird "home sweet home".

Place blocker between fairing and stabilator

Here are the dimensions we use.

Darius Johnson  
Camp Robinson AASF  
North Little Rock, AR

# CAN'T FIND MAINTENANCE STAND PARTS?

SERGEANT BLADE, THIS STAND DOESN'T SOUND OR LOOK TOO GOOD.

LOOKS LIKE YOU COULD USE SOME PARTS!

UNFORTUNATELY, THE LOW LEVEL MAINTENANCE PLATFORM, NSN 1750-00-269-8283, DOESN'T HAVE A TM.

IF YOU WANT TO GET RID OF THAT "CLINKING," "CLACKING," AND "WOBBLING"...

YOU CAN ORDER THE PARTS YOU NEED FROM THIS LIST...

- Wheel assembly with universal brake, NSN 5340-01-340-8799
- Latch assembly-clamping catch, NSN 5340-00-787-3209
- Catch, clamping latch, spring-loaded, NSN 5340-00-760-9241
- Quick release pin, NSN 5340-00-935-8804

# KEEP COOL, AND YOUR AVIONICS, Too

I KNOW  
IT'S HOT...  
I'M ABOUT  
TO HOOK  
YOU UP!

HURRY! MY  
COMMUNICATION  
COMPONENTS  
ARE GETTIN'  
HOT!

MAKE  
SURE HE  
USES LOOP  
CLAMPS!

YEAH!  
DON'T LET  
THE ECU  
CABLE  
HANG!

AIR TRAFFIC CONTROL  
OPERATORS, WHEN YOU  
SET UP YOUR FLIGHT  
COORDINATION CENTRAL,  
AN/TSC-61B, KEEP  
THE ENVIRONMENTAL  
CONTROL UNIT'S POWER  
CABLE OUT OF  
HARM'S WAY.

The AN/TSC-61B operates best when you and the electronic communications equipment inside the shelter stay cool.

A good rule of thumb to keep cool and protect yourself and the ECU power cable is to secure it only across the doorway. Use loop clamps, NSN 5340-00-891-3412, to support the cable. And don't route the cable through the lifting eyes, either.

Attach cable  
with loop clamp

If you let the power cable hang in the doorway like a bat in a cave, the door can damage the power cable and knock out the ECU. If you route it through the shelter's lifting eyes, the lifting hooks can crush the cable while moving or lifting the shelter.

No power cable means you lose cool air, and the radios and other electronic components inside the shelter that control flight operations overheat and burn out. Then you won't be communicating or coordinating with aircraft in the air or on the ground.

If you're tempted to run any power cable on the ground, forget it. That leaves the ECU power cable vulnerable. Foot and vehicle traffic can crush the cable or rip the cable loose from the connectors. It causes a tripping hazard, too.

Elevate and mark all cables with white cloth or tape to avoid damage.

Don't route through  
or over lifting eyes

Don't let  
cable hang

# Remember Ramp Flags?

Ramp flags have been showing up lately—again. If you have ramp flags, NSN 8345-00-543-6914, attached to your airfield and flight line ground vehicles, you need to ask yourself a question: “should we still be flying those checkered flags?”

The latest word in FM 1-300, *Flight Operations Procedures*, says nothing about the use of ramp flags on flight line vehicles—such as tugs or tractors—while they tow aircraft. So forget ramp flags.

In the past ramp flags were used as a safety precaution on fixed wing aircraft runways. Still, ramp flags are considered a safety hazard in and around hovering helicopters.

Also, flags can become FOD material if they get caught in rotor blades or get ingested by an aircraft engine.

# MAKE SURE BARREL IS CLEAR

...BECAUSE THERE WAS A ROUND STUCK IN THE BARREL THAT HE HADN'T CHECKED FOR.

"WHAT THE ARMY THINKS HAPPENED IS THAT HIS MK 19 FIRED THREE ROUNDS, BUT STOPPED ON THE FOURTH ROUND BECAUSE OF A SPLIT CARTRIDGE CASE."

"HE REMOVED THE CASE, BUT DIDN'T CHECK FOR A STUCK ROUND. HE TRIED TO FIRE AGAIN. THE FIFTH ROUND HIT THE FOURTH ROUND STUCK IN THE BARREL AND THE BARREL EXPLODED."

# KNOW YOUR LIMITS

Your M16-series rifle or M4A1 carbine is the best friend you'll have in battle. That's why you need to give it all the PM attention it needs.

But there is a widespread problem in the Army. Some soldiers want to give their M16 or M4A1 too much attention. They want to do not only their job, but also the armorer's and maybe even direct support's. The results of doing more than you should can be disastrous for your weapon.

- Don't disassemble the lower receiver and trigger assembly for better cleaning.

If you continually push out the receiver pins, you enlarge the receiver holes. The holes can't hold the pins and the receiver is ruined.

If the trigger assembly is put together wrong, the weapon fires automatic when it's not supposed to. That's dangerous.

- Don't remove the buttstock to clean the lower receiver extension.

The takedown pin spring is easily damaged and difficult to install correctly. If the spring and detent are not put back in right, the takedown pin won't lock in and your rifle won't stay together. You could also loosen the lower receiver extension, which could let the buffer detent and spring pop free.

- Don't remove the compensator to clean the barrel.

The compensator must be torqued just right. If it's screwed on too tight, the barrel threads--and barrel--are ruined. If it's too loose, it can vibrate off.

- Don't give your M16 or M4 a bath.

Water trapped in tight places corrodes metal parts like the carrier key, forward assist spring, trigger spring, and sear spring.

- Don't remove the self-locking screw in the buttstock.

Once the screw is removed, it's no longer self-locking. It won't hold and the buttstock can turn while firing.

- Don't use stuff like oven or toilet bowl cleaners or homemade cleaning tools on your rifle.

- Don't use the bore brush on the outside of the weapon.

These things will get your rifle or carbine wonderfully clean, but they also take off its protective finish and ruin the barrel grooves. Soon your weapon is junk.

- Don't take off the heat shields for cleaning.

Leave heat shields alone

You'll ruin the hand-guards if you remove the heat shields. That's why it says **DO NOT REMOVE** on the heat shields.

The bottom line is that if you want to do your M16 or M4 a favor, do everything TM 9-1005-319-10 says to do, then **stop**. If your weapon needs more attention, tell your armorer. He has the tools and training to either fix it or get it to support.

Small Arms...

## NOW SEE THIS: ADJUST SIGHTS RIGHT

**HOLD IT!** USE THE **RIGHT** TOOL TO ADJUST YOUR SIGHT OR YOU'LL SOON BE SIGHTLESS!

**R**ifles and machine guns spend too much time sitting in direct support shops because armorers and gunners don't use the right tool to adjust the front sights.

They grab what's handy—a bullet, a nail, or a multi-purpose tool—and start poking and turning the front sight detent or post. That's OK on the battlefield where you're concerned with life and death. But it's not OK in a training environment. Using the wrong tool to adjust the sight again and again on the range soon ruins the sight. Then the weapon has to go off to support for repairs.

All of this can be avoided if every armorer and squad leader carries and uses the correct sight adjustment tool.

There is no NSN for the M16 rifle/M4 carbine front sight tool. You have two choices: have the tool made by support using the diagram on Page E-2 in TM 9-1005-319-23&P or go to your local gun shop and buy the tool. Most units have found it cheaper and easier just to buy the tool.

THE M240B MACHINE GUN SIGHT TOOL COMES WITH NSN 1005-01-458-7004 AND COSTS \$56.

# Fired Up with PM

YOUR M157 SMOKE GENERATOR WILL SMOKE LIKE A THOUSAND CHIMNEYS IF YOU KEEP IT FIRED UP WITH THIS PM.

## Air Release Valve

Hit the valve at the end of every smoking mission and hold it in until all the air is out of the system. Otherwise, condensation forms in the air lines, corrosion sets in, and soon the air lines start to leak.

## Hoses

The air and fog oil hoses are virtually the same size and it's easy to confuse them. If the air tank won't build up pressure, make sure you have the tank hooked up to the air hose.

## Fog Oil Strainers

Clean them at least weekly when you're smoking. Fog oil is often dirty and clogs the strainers quicker than other fuels clog filters. Clogged strainers make it difficult for the generators to draw fog oil and the generators can overheat. Rinsing the strainers in diesel fuel is an easy way to clean them.

## Wedge Blocks

Make sure each generator has two wedge blocks installed. The blocks are often missed when the generators are reinstalled. Without the blocks, the generators bounce around during travel and all sorts of components are damaged.

## Control Panel Knobs

Don't force the knobs. If you muscle them past their stops, you break the knobs and then the control panel can't control smoking. Operators often break the knobs because they turn them fast and hard. That's not necessary. Slow and easy is fine for smoking.

## Storage

Don't store gear on top of the fog oil tank. Gear bounces around during travel and breaks the cable and fog oil line connectors on top of the tank. Then you can't smoke. Never store picks, shovels or other gear between the fog oil tank and tank straps. That can cause the straps to crack and the tank can break loose.

## Control Panel Cables

If any of the six cables to the control panel are loose or cross-threaded, you could get false indicators when you turn on the control panel—particularly the FIRE warning light. If you're getting false indicators, check that the cables are correctly installed.

You have to see the connectors to tell if they're cross-threaded. The easiest way to visually check them in the track version of the M157 is to remove the top screws holding the brackets to the control panel. Loosen the bottom two screws and swing the control panel toward you. You can just bend over and look at the cables in the truck version.

## Fuel Cans and Hoses

It's a good idea to keep the fuel cans more than 1/4 full. If the fuel level gets much lower than that, the generators have trouble drawing fuel. The best bet is to fill the fuel cans before you smoke. If you've been smoking a long time and aren't sure of the fuel level, use a flashlight to check.

Check the fuel hoses weekly for dry rot and cracks. If the hoses sprout holes, fuel sprays everywhere. Make sure the hoses are routed to the outside of the taillights on the track version. If they run along the inside the lights, the ramp can catch the hoses and tear them off.

## Head

If you have to remove the head during smoking, remember it's very hot. It's a good idea to wear heavy gloves **and** use a rag when you handle the head. Don't leave the smoke chamber open. Flames can shoot out the head opening and fricassee you. Put the head blank in until you're ready to replace the head.

Dear Editor,

This suggestion will make adjusting the M17 decon's flow switch easier: Once the M17 has been running awhile, it is very difficult to adjust the flow switch with a normal screwdriver without burning yourself on the exhaust. We avoided burns by making a long-handled screwdriver out of 1/4-in rod.

Cut off a 3-ft piece and bend one end in a vise to form a handle. Flatten the other end so it will fit the flow switch screw. Then you can adjust the switch without getting your hands near the hot exhaust.

Bend one end for handle and flatten other end to fit switch screw

SGT Richard Morris  
F Co, 782d MSB

CHANGE 6 TO  
TM 9-1095-208-10-1  
AUTHORIZED MOUNTING  
THE VOLCANO ON THE  
FMTV M1090 5-TON  
DUMP TRUCK.

# FUEL IN -SAND OUT

IT'S A DIRTY JOB BUT SOMEONE HAS TO DO IT!

WE'VE GOT THE SCOOP ON GOOD PM RIGHT HERE!

WHEN YOU TALK TO AN OPERATOR IN ANY ENGINEERING BATTALION, HE WILL TELL YOU IT'S A DIRTY JOB. BUT WHAT THE HECK, SOMEONE HAS TO DO IT!

THAT DIRTY JOB MEANS DUST AND SAND CAN GET INTO THE VEHICLE'S FUEL. COMMERCIAL CONSTRUCTION EQUIPMENT IS BUILT TO LAST, BUT DIRTY FUEL WILL PUT IT DOWN IN A HURRY.

THESE PM POINTERS ARE A GREAT WAY TO KEEP EQUIPMENT MISSION-READY WHEN IT COMES TO FUEL MATTERS IN THE DESERT.

- Keep your fuel supply covered and protected.

- Before you refuel equipment, wipe off any sand around the fuel tank's filler cap.

- Before the day's run, drain off water and sediment from the fuel system's fuel/water separator. Water can rust out the fuel system. Sand in the fuel system can damage the engine's ejectors.

- Fill the fuel tank at the end of operations to help prevent condensation in the tank.

- If it's raining or sand is blowing, lay a clean rag around the nozzle while you refuel. When refueling is done, replace the cap and snug it down to keep dirt out during operations.

If your equipment's fuel tank has a strainer, make sure it's in place and in good shape. If it's damaged or missing, replace it.

WITH GOOD FUEL PM, YOU'LL KEEP THE SAND AND WATER WHERE THEY BELONG—OUT OF THE VEHICLE'S FUEL SYSTEM.

# PADS PROTECT KNEES AND ELBOWS

## M113A3 STEER LOCK CONVERSION

Mechanics, hold off on replacing a bad electrical steer lock solenoid, NSN 5945-00-933-8450, on the M113A3 FOV. Instead, get your DS to install the new electrical-to-mechanical conversion kit, NSN 2520-01-434-8596. At around \$435, the kit costs more than a new electrical solenoid, but it also lasts a lot longer.

## TACTICAL GROUNDING PAMPHLET

If it's your job to ground or bond tactical equipment, you can't do the job right without CECOM TR-98-6, *Earth Grounding and Bonding Pamphlet: A Guide to Proper Grounding and Bonding Methods for Use with Tactical Systems*. The pamphlet is 46 pages of good grounding info and PS will email it to you as a PDF file. Just write to Half-Mast and ask for it.

## 3-KW TQG Freq Converter Change

Item 49 of Fig 2 in TM 9-6115-639- 23P gives you a choice of two frequency converters for the 3-KW TQG—a 60-Hz and a 400-Hz model. But the part numbers are flopped! Pencil that change in your paper TM and then order a 60-Hz converter (the one you probably want) with NSN 5895-01-477-0855 and a 400-Hz converter with NSN 5895-01-477-0858.

## No Hoffman or M21 on M109s

The M21 artillery flash simulator is designed to be loaded into a Hoffman training device to simulate firing of the M1-series tank's main gun. The M21 and Hoffman are not authorized for use on M109-series SP howitzers. Using them on the howitzer may result in malfunctions. Ammunition Information Notice (AIN) 40-03 (221919Z APR 03) has the scoop. Send an e-mail to [jmc-ofc-qas@osc.army.mil](mailto:jmc-ofc-qas@osc.army.mil) or call Quinn Williams at DSN 793-7561 for a copy.

## SOLVENT GLOVES NSN

Need some protective gloves to use while working in a solvent tank? Get them with NSN 8415-00-266-8675. They're the gloves found in the No. 1 Common tool set. They're rubber, size 11, 14 inches in length, with a gauntlet cuff.

DISTRIBUTION: To be distributed in accordance with the initial distribution number (IDN) 340312, requirements for TB 43-PS-Series.

Would You Stake Your Life <sup>right now</sup> on the Condition of Your Equipment?

*If your radio could talk,  
it would thank you.*
